Quiz 2 question 5 wording change request.

For the question reading in the fixed width file could we change the wording

from

Read this data set into R and report the sum of the numbers in the fourth column.

to

Read this data set into R and report the sum of the numbers in the fourth of the nine columns.

because

The question, as it stands, assumes people read the data in using a combination of fixed width settings that gives them, however since the question doesn't specify a particular set of settings people can (and have) used fixed width import settings that read in the spaces between columns as columns filled with NAs, or interpret the first date column as being three fixed width columns of day month and year rather than one date column. Clarifying

The future of education is plain text

 [moocs](#)

I was recently at a National Academy meeting on [Envisioning the Data Science Curriculum](#). It was a fun meeting and one of the questions that came up was what kind of infrastructure do we need to enable shared curricula, compatibility across schools, and not reinventing the wheel. My answer to this question was that we need lecture notes stored in plain text files (like [markdown](#) files) and data stored in [csv files](#) with direct links.

I am not nearly the first person to make this argument. [Lorena Barba](#) explained why her MOOC doesn't use video almost two years ago now. More recently a blog post pointed out some advantages of plain text code files for [data analysis](#). I'm sure there are more that I don't know about.

I think that the future of education is in plain text documents (not just for data science) and that the future of data storage is in simple csvs for all but the most complicated data sets. Why?

- **Plain text is always compatible** Every single operating system has a plain text editor and they are all compatible up to the encoding of the text. This means that if you develop your lecture notes on a Mac and I develop them on a PC then we can still easily share - no worrying if you have the right software.
- **Plain text is easy to mix and match** If your lecture materials are in a simple plain text format like markdown you can copy and paste the materials from one lecture into another and when the document is compiled make all the formatting/colors/etc. match. No more looking at hodgepodes of borrowed slides some with one ppt format and some with another.
- **Plain text is easy to maintain** We mostly work on scalable education here at the JHU [Data Science Lab](#).

Components of a MOOC

- **Tutorials** - easy to write in plain text
- **Slides** - easy to make and edit in Google Slides
- **Quizzes and Assessments** - easy to write in plain text
- **Videos** - challenging to create in plain text

Amazon Polly

Turn text into lifelike speech using deep learning

[Get started with Amazon Polly](#)[Listen to Amazon Polly >>](#)

Amazon Polly is a service that turns text into lifelike speech, allowing you to create applications that talk, and build entirely new categories of speech-enabled products. Amazon Polly is a [Text-to-Speech](#) service that uses advanced deep learning technologies to synthesize speech that sounds like a human voice.

With dozens of lifelike voices across a variety of languages, you can select the ideal voice and build speech-enabled applications that work in many different countries.
