Data Science on a Chromebook

Jeff Leek 2017/08/29

chromebook

About nine months ago I [announced](#) that I was attempting a Chromebook experiment for the 2nd time. At first I thought it was going to be a short term experiment just to see if it was possible to function with only a Chromebook. But in an interesting twist I got used to it and have been working exclusively on a Chromebook for the last few months since the experiment started.

I set myself the following requirements:

1. I could only use Chrome OS - no installing/booting to Linux
2. I couldn't use another computer for any task
3. I had to be "fully cloudy" in the sense that I didn't run any additional hardware

One of the reasons I did this was I wanted to see if it was possible to be a functioning/day to day data scientist without using an expensive laptop. This is part of a broader experiment I'm just beginning on how to [democratize data science education](#).

I'm not going to go into extreme detail on how I set everything up here (more on that in a second) but I thought I'd describe my Chromebook set up that I've been using for the last couple of months.

I have been using two [Samsung Chromebook Plus](#) computers, one of which I keep at home and one which I keep at work. One of the best parts about the fully cloudy/Chrome OS requirement is this means that from the user perspective everything is always in sync. I log off the computer at home, come to work, log on and its like I'm on the same computer.
